

## Central Wire Union Plant Response to EPA Comments on the June 2014 Monthly Progress Report

Central Wire has listed the EPA comments and has responded to each comment in blue italics below the comment.

1. Part 1. Autumwood does not appear to have updated the discussion of the pumping at the Central Sod wells from the previous months report. This update should be done.

*The update is included in the revised report attached to this response to comments.*

2. Discussion of Marengo Precipitation Data, a discussion of how to download the data or how difficult it is to get this data printed is not needed. Autumwood should just provide the information without comment.

*See revised report.*

3. Part 2.  
MW-2 data. There has not been a maximum contaminant level (MCL) exceedences in this well since December 2007, not March 2008.

*See revised MW-2 plot*

4. MW-4. The spread sheet only contains barium data for June 2005 that can't be attributed to a specific well. Why is this sheet here? Where is the rest of the data?

*Apparently there was a glitch in the file. Please review the attached plot for MW-4.*

5. MW-5D, to my mind the discussion indicates an absence of trichloroethene (TCE) MCL exceedances for at least a few years prior to June 2014. There have been several TCE exceedances in the 2005-2014 time frame. This text should be re-written.

*Central Wire believes this comment is related to the MW-5 plot where TCE has not been exceeded since January 2005. MW-5D exceeds the MCL for TCE which was found at 15 ug/L in June 2014. No other MCLs have been exceeded since PCE was found at 49 ug/L in June 2005.*

6. The last exceedances of the dichloromethane MCL in well MW -7 was in December 2009. The text should be corrected.

*See revised report.*

7. Discuss the residential well sampling. Or at least mention when it's going to be discussed.

*See revised report.*
